

HYBRID ZONES

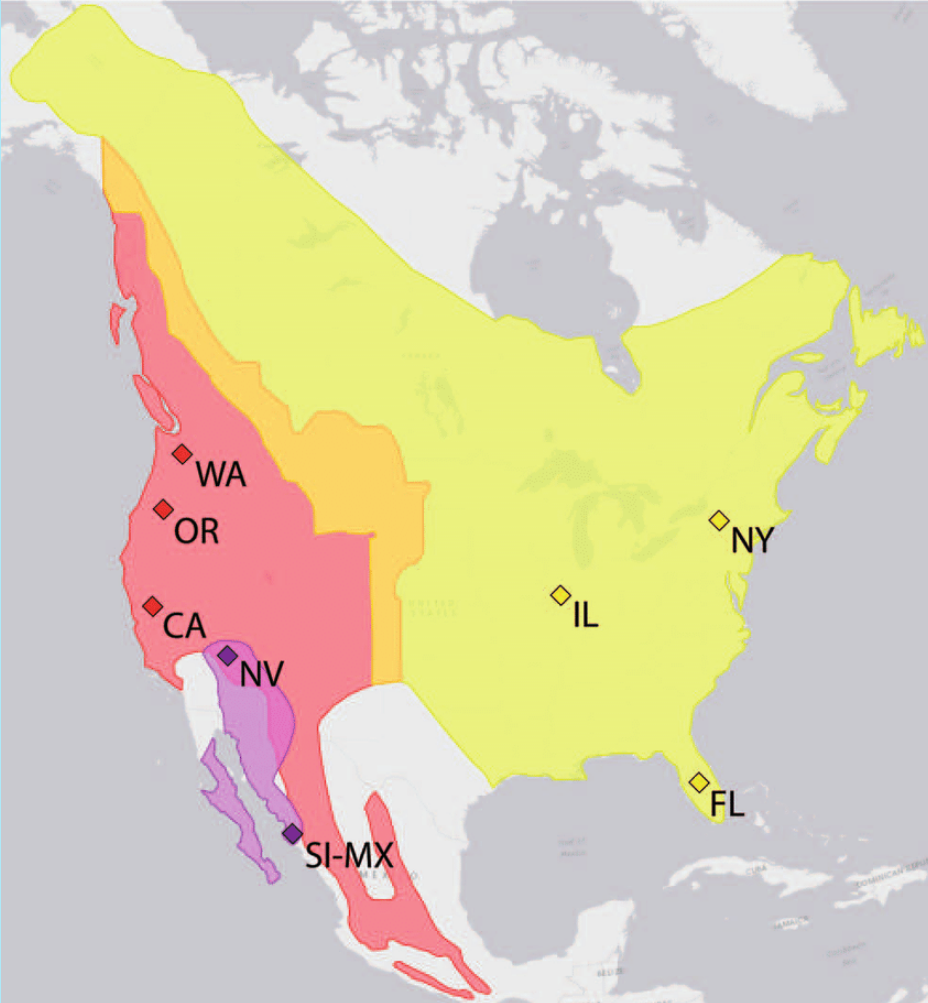

FREQUENCY OF HYBRIDS

- ▶ Once thought extremely rare
- ▶ Hybrid speciation fairly common – DNA analysis

Gilded
(*C. chrysoides*)

Red-shafted
(*C. auratus cafer*)

Yellow-shafted
(*C. auratus auratus*)

HYBRID ZONES

- ▶ Examples of incomplete **speciation**
- ▶ Also sources of **speciation**
 - ▶ Genetic differences have evolved
 - ▶ But don't prevent interbreeding

QUESTIONS I'LL TRY TO ANSWER

- ▶ How do hybrid zones form ?
- ▶ What makes the Titmouse hybrid zone stable since the Pleistocene?
- ▶ Why don't these two interbreeding species become a new species?
- ▶ Why doesn't one species push the other out?

HYBRID ZONES: NATURAL LABORATORIES

- ▶ May form when divergent populations re-contact:
 - ▶ **Secondary contact**
- ▶ Unique opportunities to study
 - ▶ **Speciation**
 - ▶ **Adaptation**
 - ▶ Ecology
 - ▶ Behavior
 - ▶ Morphology
 - ▶ Climate change

HYBRID ZONES: NATURAL LABORATORIES

- ▶ Relative strength of **selection** vs **dispersal**
- ▶ Extent & cause of divergence
- ▶ Relative influences of **natural** and **sexual selection**
 - ▶ Which traits diverged ?
 - ▶ Which traits contribute to reproductive isolation ?
 - ▶ Which traits contribute to adaptative success ?
- ▶ Titmice surveys
 - ▶ 1955,
 - ▶ early 2000s
 - ▶ 2014 (Tx & Ok)
 - ▶ Examination over time

SECONDARY CONTACT

Black-crested

Tufted

DIVERGENCE

SECONDARY CONTACT

Populations eventually meet

WHAT HAPPENS NEXT?

Whoopie !!!

Populations start to interbreed

Haven't changed so much that they can't interbreed.

HYBRID ZONE IS CREATED

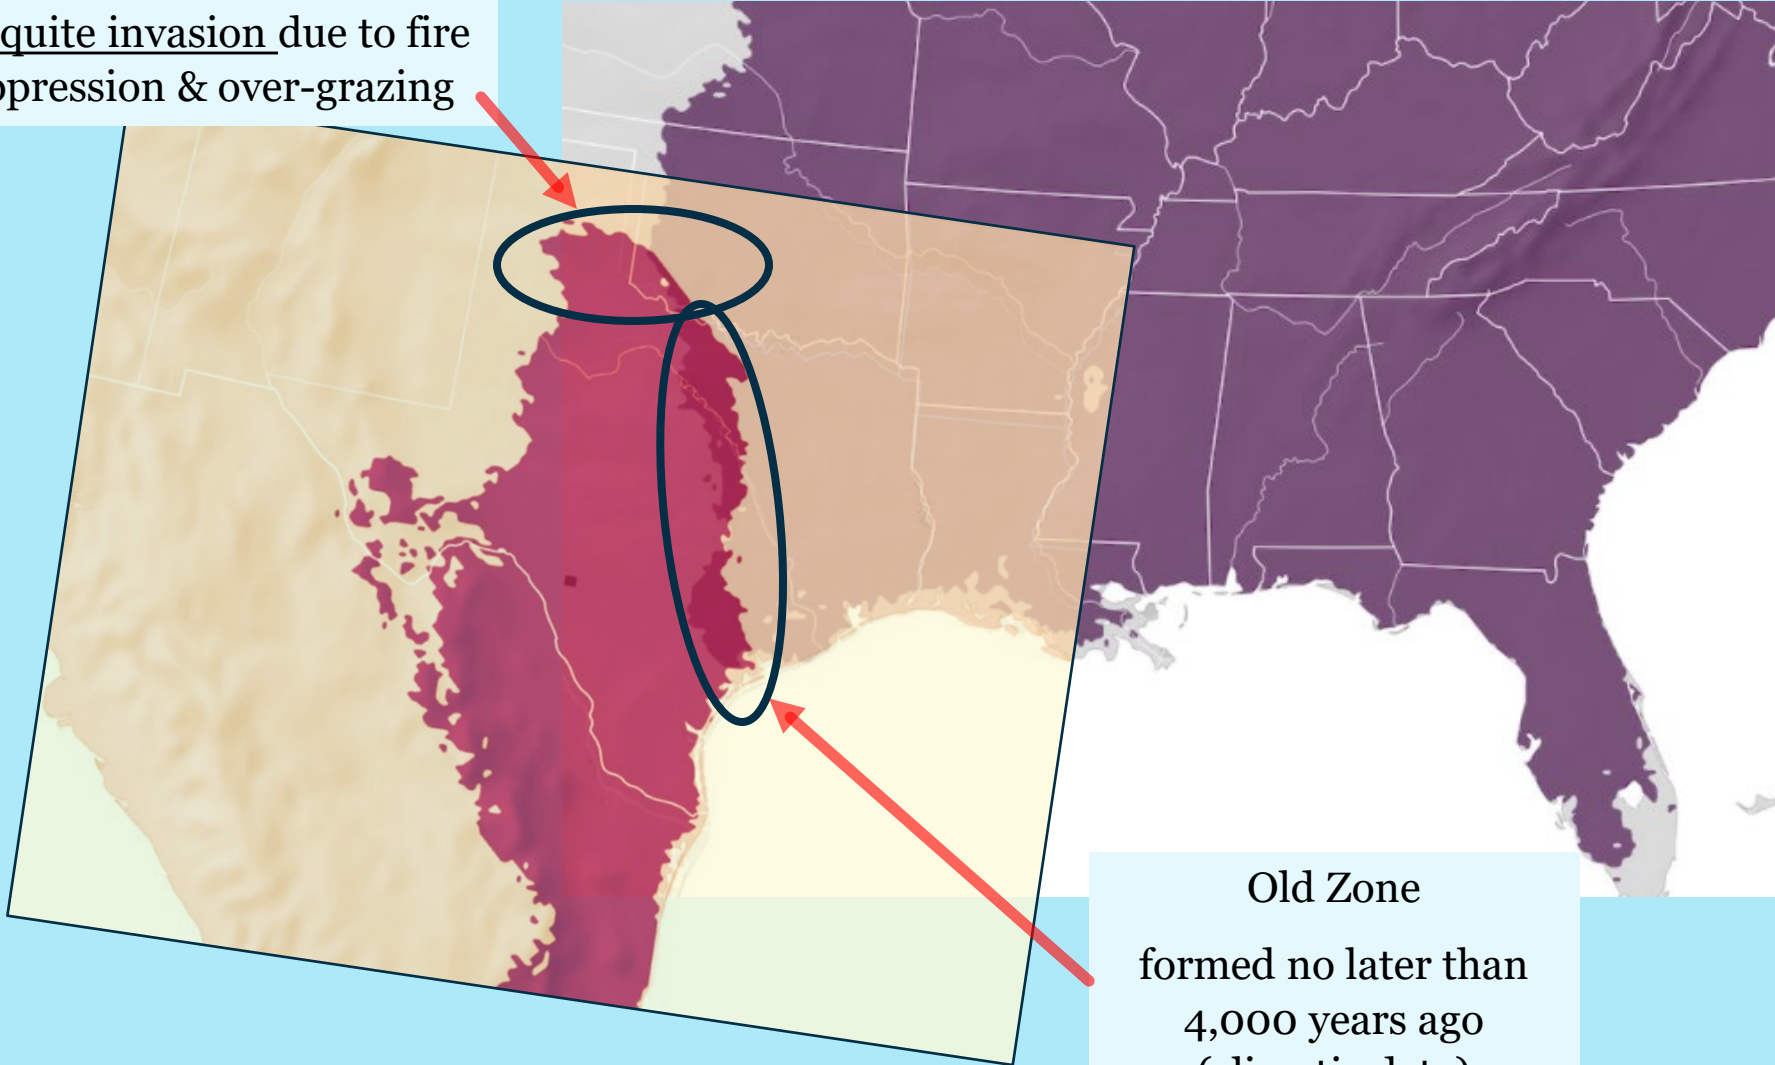

2 HYBRID ZONES

Young Zone

Formed in last 100 years

change in habitat &
subsequent range expansion
mesquite invasion due to fire
suppression & over-grazing

Old Zone

formed no later than
4,000 years ago
(climatic data)

SECONDARY CONTACT

Something brings the populations back together

Habitats change.....

SECONDARY CONTACT

▶ 2 main possibilities

1. No interbreeding
2. With interbreeding

NO
INTERBREEDING

SECONDARY CONTACT

**NO
INTERBREEDING**

FIRST OF ALL

Male ornamentation/display
Unattractive
FEMALE CHOICE !!!

**Selection
balances
Dispersal**

SECONDARY CONTACT

Unsuccessful in
new habitat

**Selection
overwhelms
Dispersal**

NO
INTERBREEDING

SECONDARY CONTACT

overwhelms
Selection

1 species
out-competes
(ecologically)

WITH
INTERBREEDING

WHAT CAN HAPPEN AT SECONDARY CONTACT?

- ▶ Interbreed
 - ▶ Hybrid zone is created
 - ▶ **Ephemeral** – recent meeting of two divergent forms that blend back together
 - ▶ **Stable** – balance between **selection** & **dispersal**
 - ▶ **Expanding**

SECONDARY CONTACT

INTERBREEDING

Hybrids are unfit
(sterile, weak, unviable
or just less fit than parents)

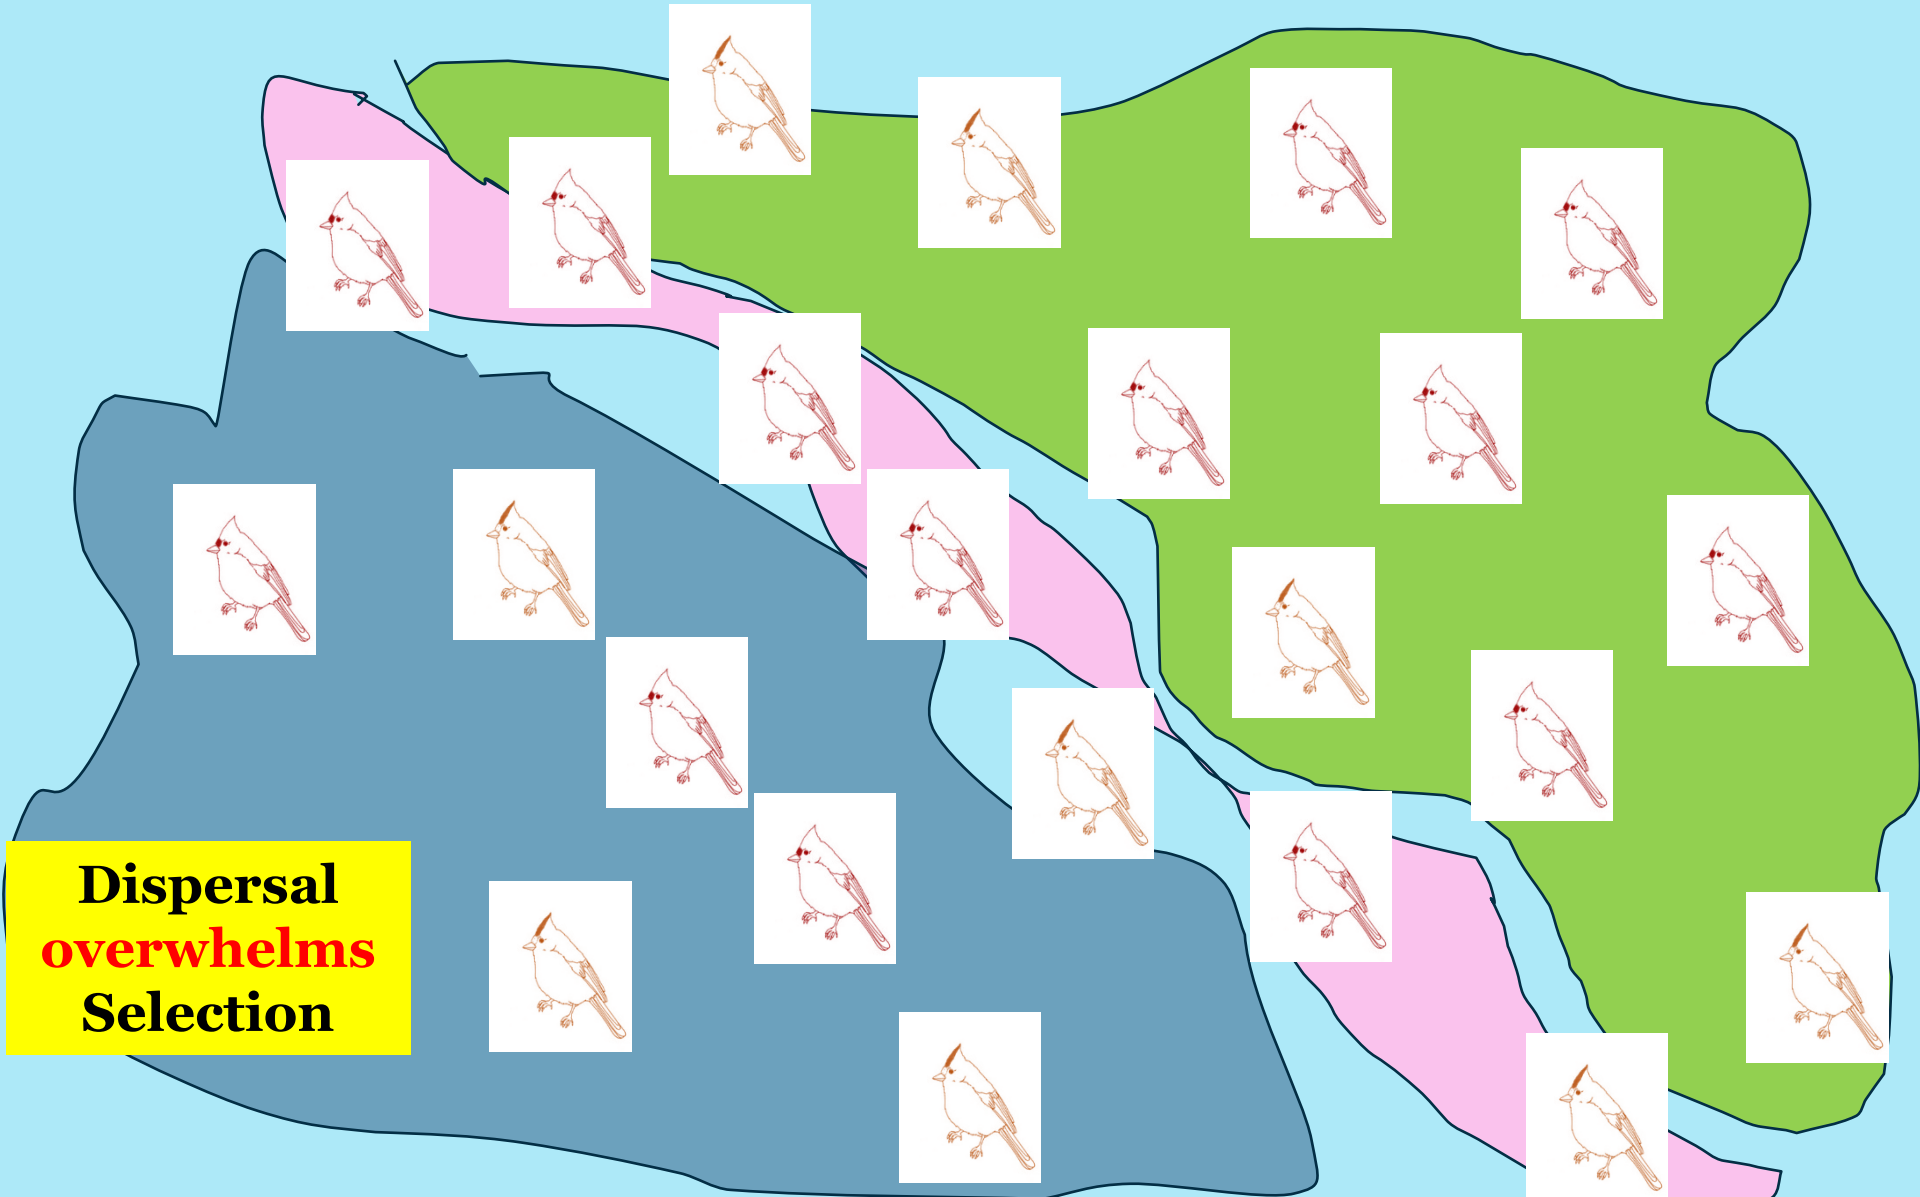

**Selection
overwhelms
Dispersal**

SECONDARY CONTACT

Combine to form
new species

INTERBREEDING

HYBRID ZONE FORMS

Hybrid zone is **Stable**

INTERBREEDING

Dispersal
balances
Selection

STABLE HYBRID ZONES

- ▶ Two species remain
- ▶ Continue to produce hybrids
- ▶ No net change

- ▶ **Selection balanced by dispersal**

- ▶ Hybrids slightly less fit than parent species
 - ▶ Less fit in specific habitat
 - ▶ Common with hybrids

FITNESS OF HYBRIDS IN THE HABITAT

- ▶ Hybrid fitness < Parent species fitness (usual)
 - ▶ Less fertile
 - ▶ Less successful in breeding
 - ▶ e.g. less able to attract mate
 - ▶ May be weird
 - ▶ Less competitive for food, survival....
 - ▶ Many examples
- ▶ Reinforces the original speciation (**reinforcement**)

- ▶ Hybrid fitness = Parent species fitness
 - ▶ May merge into a single new species (fusion)

- ▶ Persisting hybrid form
 - ▶ Must out-compete parent species in that habitat

OUR TITMICE
HYBRID ZONES

TWO HYBRID ZONES

- ▶ Texas (“old hybrid zone”)
 - ▶ 2 populations interbreeding for several thousands of years
 - ▶ Meet at natural ecotone
 - ▶ Known to interbreed in Texas since 1880s (Ridgway (1887))
- ▶ Oklahoma (“young hybrid zone”)
 - ▶ Until early 20th – no Black-crested in Oklahoma
 - ▶ Range expansion into SW Oklahoma
 - ▶ Should leave unique genetic footprint
- ▶ Multiple studies & 2 hybrid zones
 - ▶ See how hybrid zones change over time

Claire M. Curry; Michael A. Patten

Hybrid index is a sum of crest (0 to 3) and forehead (0 to 3) values.

STUDY METHODOLOGY

“HYBRID INDEX”

		Crest Score			
		0	1	2	3
Forehead Score	0	0	1	2	3
	1	1	2	3	4
	2	2	3	4	5
	3	3	4	5	6

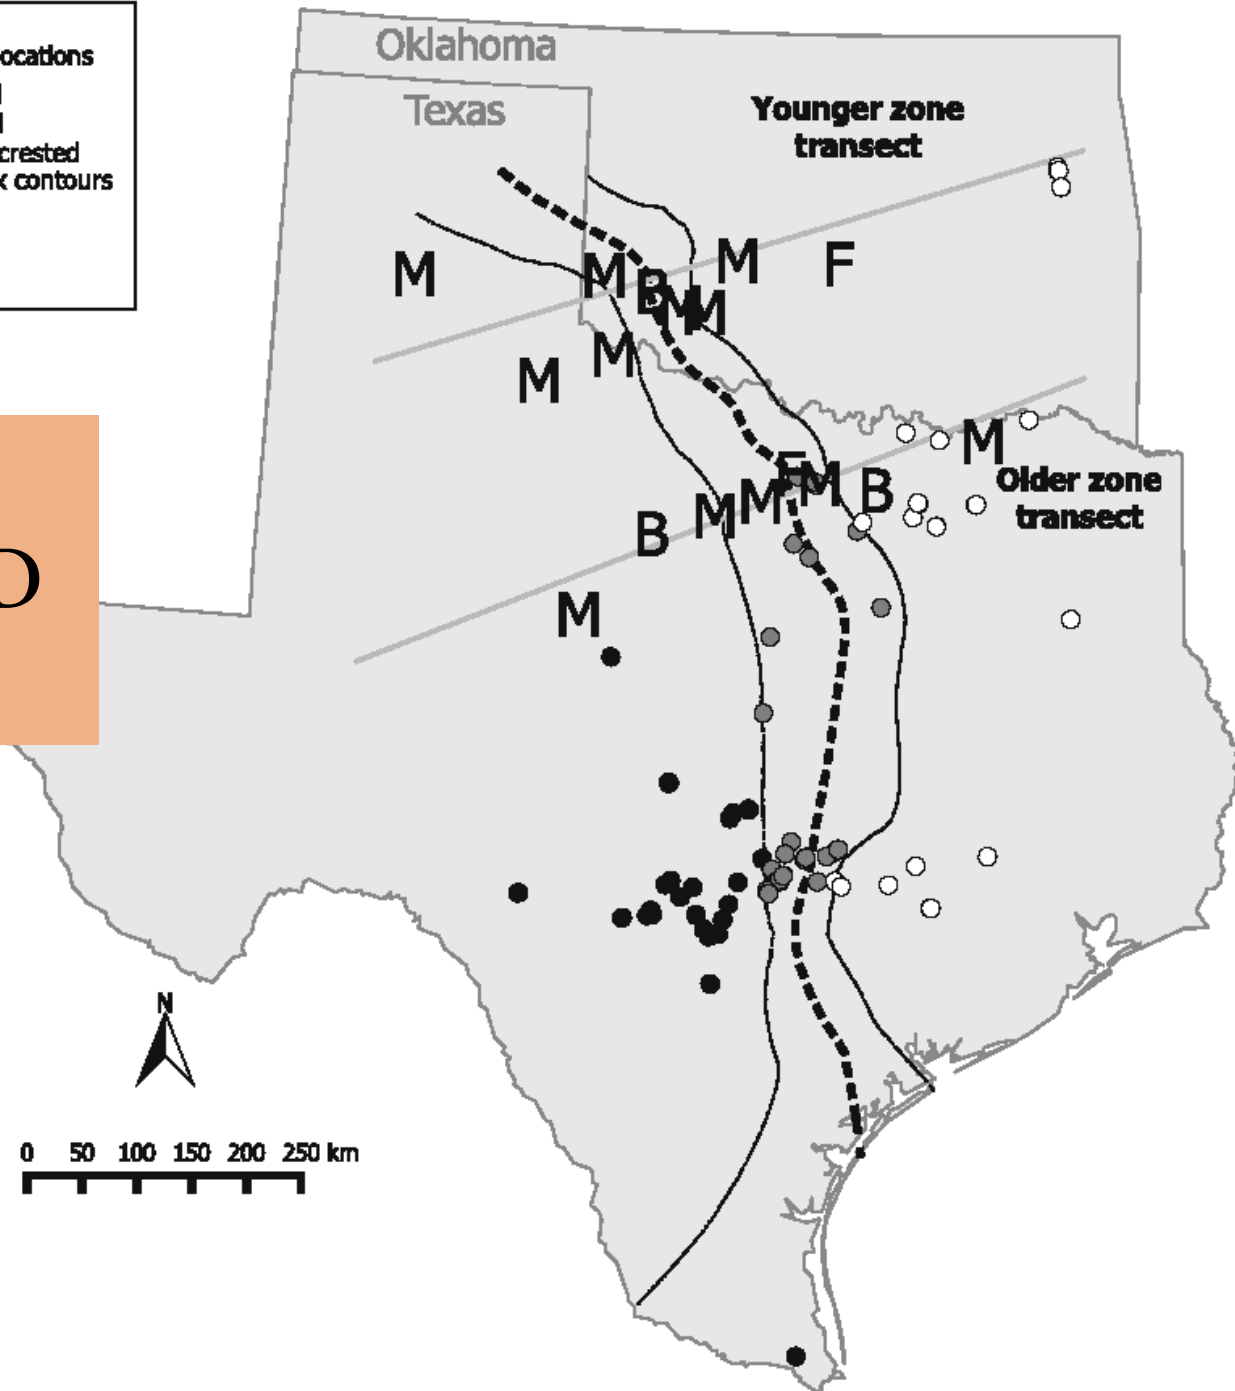

- ▶ Crest + forehead colors
- ▶ Crest (0 to 3) + forehead (0 to 3)
- ▶ Plumage scale from 0-6

- ▶ Outside of hybrid zone:
 - ▶ 0–1 (Tufted) or
 - ▶ 5–6 (Black-crested)

Pure Tufted	Hybrids					Pure Black-crested
0	1	2	3	4	5	6

- ▶ Inside hybrid zone
 - ▶ Large range of intermediate plumages (0-6)

THE HYBRID ZONE

A map of Texas counties with a dashed line running north-south through the center. Three red stars are placed along this line, with red arrows pointing to labels: 'Jeff's Dacha' (top), 'Baker Sanctuary' (middle), and 'Blair Woods' (bottom). An orange star is placed near the city of Austin, with the word 'Austin' written in orange text next to it. The map shows various county names such as San Saba, Lampasas, Burnet, Williamson, Bell, Falls, Robertson, Milan, Burleson, Blanco, Espie, Travis, Bastrop, Fayette, Colorado, Guadalupe, Bexar, and Lavaca.

Hybrid zones cluster
in “suture zones”

Eastern edge of
Rockies – one of the
most extensive suture
zones

THE HYBRID ZONE

THE HYBRID ZONE

HYBRID ZONE
WIDTH & CENTER
(NATURAL LABS)

WIDTH OF HYBRID ZONE

- ▶ Measured over transects at several time periods
- ▶ Width can be:
 - ▶ Stable (width & location)
 - ▶ Expand
 - ▶ Contract
 - ▶ Center moves while remaining same width
 - ▶ Represents shifts in overall population density between species
 - ▶ No consistent pattern

WIDTH OF HYBRID ZONE

- ▶ Help determine what maintains species
- ▶ Stable width = stable hybrid zone
 - ▶ Balance between **selection & dispersal**
 - ▶ Allows estimation of dispersal and selection
- ▶ **Expansion – selection & dispersal** imbalanced
 - ▶ Requires sexual selection for hybrids (YOU'RE HOT),
or
 - ▶ Adaptive advantages for hybrids

CENTER OF HYBRID ZONE

- ▶ Characteristics of individuals at center of zone
- ▶ Evaluate **selection** vs **dispersal**
- ▶ Resemble parents
 - ▶ Fewer generations of hybrid
 - ▶ = high **dispersal** & strong **selection**
- ▶ Different from parents
 - ▶ Many generations of hybridization & back-crossing
 - ▶ = low **dispersal** & weak **selection**

TEXAS HYBRID ZONE

- ▶ Secondary contact
- ▶ 2 populations interbreed 4-6 thousand years
- ▶ Stable hybrid zone forms
- ▶ **Selection** in equilibrium with **dispersal** (stable width)
- ▶ **Selection against hybrids** helps maintain 2 species
 - ▶ Black-crested (Texas hybrid zone)
 - ▶ Plumage under sexual selection
 - ▶ Parental species prefer **conspecific** song and plumage

OKLAHOMA HYBRID ZONE

- ▶ Recent secondary contact ~100 years
- ▶ Black-crested expanded range
 - ▶ Range fires became less frequent following settlement (~1870)
 - ▶ Woody plants invaded prairies
- ▶ Black-crested & Tufted
 - ▶ Few preferences by males or females for song or plumage
- ▶ Potential for continuing expansion
- ▶ Or other changes in hybrid zone

PHYSIOLOGICAL ADAPTATIONS

- ▶ During isolation sister lineages may develop physiological adaptations to differing environmental conditions
- ▶ Appears to be true here:
 - ▶ Blood glucose concentrations increase under stressful conditions
- ▶ Black-crested
 - ▶ Increased blood glucose concentrations
 - ▶ Lives in semi-arid environment = chronic stress
 - ▶ Unpredictable food & water & heat
 - ▶ Better able to deal with the stress
- ▶ Tufted
 - ▶ More aggressive
 - ▶ Physiological factors limit range expansion
 - ▶ Physiological adaptations to stress, aridity, heat
 - ▶ Less able to deal with different habitat
- ▶ Hybrids slightly less fit than parental species

THE TITMOUSE STORY

THE TITMOUSE STORY

SUMMARY

Era	Period	Epoch	Age
Cenozoic	Quaternary	Holocene	0.01 Ma
		Pleistocene	
	Tertiary	Pliocene	1.8 Ma
		Miocene	5 Ma
		Oligocene	24 Ma
		Eocene	34 Ma
		Paleocene	55 Ma
Mesozoic	Cretaceous	Late	99 Ma
		Early	144 Ma
	Jurassic	Late	159 Ma
		Middle	180 Ma
		Early	206 Ma

Range expansion by Black-crested into Oklahoma creates younger hybrid zone (100 BP)

Secondary contact occurs (initially along forested river courses that connected ranges) creating older hybrid zone (4-6 thousand BP)

Titmice extend range via dispersal during a wetter period when woodlands extended into Mexico

Woodland corridor broken during a less wet period, separating titmouse into 2 populations (200-250 thousand BP)

Baeolophus originates in New World (most other Paridae, originate in Asia)

Paridae colonize New World & Africa

1 Family Paridae & Family Remizidae diverge
